More than a Xenograft.  
An easy choice.

**Straumann® XenoFlex** is a combination of 90% bone mineral (100% pure hydroxyapatite) with 10% Collagen type I. Tested to eliminate antigenicity and provide a favorable environment for new bone growth; it is composed of bovine bone and porcine collagen. Its slow resorption rate delivers extended stability – a critical advantage in cases that require a strong scaffold for long-term tissue support and esthetic needs. The collagen fibers facilitates the adhesion of proteins and signals molecules from the blood to the embedded granules to further improve the fast bony integration of Straumann® XenoFlex.

**EXCELLENT BIOCOMPATIBILITY**
- The final sterility of Straumann XenoFlex is done by gamma irradiation.
- Optimal balance of calcium and phosphate, comparable to human bone

**EXCELLENT OSTEOCONDUCTIVITY**
- The natural structure of the granular portion of Straumann XenoFlex supports osteoconduction with interconnected porous granules, enhancing integration of new bone.
- The collagen portion of Straumann XenoFlex supports the initial healing environment and the binding of the granules to the native bone. The collagen creates an environment favorable for bone generation and is decomposed overtime.

**DEPENDABLE VOLUME STABILITY**
- Xenograft granules undergo superficial resorption only. The granules provide excellent space maintenance and predictably integrate into newly formed bone ensuring volume maintenance and a strong long lasting matrix for successful placement of dental implants.

**EASY OF HANDLING AND APPLICATION**
- Size is customizable to the patient defect and can be shaped dry or wet.
- Shorten operation time is a result of placing 1 piece into the surgical area
- After hydration, Straumann XenoFlex changes to a slightly spongy consistency enabling ease of handling.

**CLINICAL APPLICATIONS**
- Sinus floor elevation
- Horizontal augmentation
- Ridge preservation
- Peri-implant defects
- Extraction sockets
- Intraosseous defects

Manufacturing process of Straumann® XenoFlex

**Step 1.** Bovine bone ground to particulate
**Step 2.** Lipid and proteins removed through vigorous washes and high temperature heating
**Step 3.** Low crystallinity achieved to create a favorable surface to which bone can adhere
**Step 4.** Bone granules (before sterilization)
**Step 5.** Mixing bone granules and collagen solution
**Step 6.** Molding
**Step 7.** Freeze drying
**Step 8.** Packaging and terminal sterilization with gamma irradiation

**Step 1-1.** Porcine skin cut into small pieces
**Step 2-1.** Lipid and other impurities removed through vigorous washes
**Step 3-1.** Inflammatory telopeptide is removed
**Step 4-1.** Purified collagen
