   - 2.1 Removal of non-osseointegrated implants  
   - 2.2 Removal of osseointegrated implants  

3. Further information  
   - 3.1 Care and maintenance  

4. Important guidelines
1. About this guide

Straumann implants have been extensively researched, clinically tested and successfully used. The optimized design follows a philosophy called Bone Control Design™, which is based on the five biological key principles in implant dentistry:

- Osteoconductivity of the implant surface
- Control of the microgap
- Biomechanical implant design
- Biological distance
- Position of the surface interface

With the Bone Control Design™, Straumann implants are designed to achieve preservation of crestal bone and soft tissue stability.

However, there might be circumstances that require a removal of an implant. In the event a removal of a Straumann implant is needed, this guide provides rules and instructions. It is valid for the whole Straumann® Dental Implant System.

This guide contains two major sections: Removal of non-osseointegrated implants and removal of osseointegrated implants.

Note:
It is the clinicians’ responsibility to assess the extent of osseointegration at the time of the planned removal.

Warning:
The descriptions given are insufficient to allow immediate use of the Straumann® Dental Implant System. Guidance in the handling of the Straumann® Dental Implant System by an operator experienced in its use is strongly recommended. Straumann implants must only be used by dentists, doctors, and operators trained in the use of the system.
Straumann products must be secured against aspiration and swallowing when used intraorally. Do not use damaged or blunt instruments. Always inspect instruments before use. The Straumann® 48h Explantation Device for the Straumann® Dental Implant System may only be used for the explantation of non-osseointegrated Straumann implants.

Warning:
U.S. federal law restricts this device to sale by or on the order of a dental professional.
2. Guidance for implant removal

2.1 Removal of non-osseointegrated implants

In principle, tools for the removal of non-osseointegrated implants must only be used within 48 hours after implant insertion. It is the clinicians’ responsibility to assess the extent of osseointegration at the time of the planned removal.

Using the 48h Explantation Device beyond the 48 hour time frame may result in damage to the device due to excessive forces applied to it. If you notice any damage to the device, please discard the tool immediately.

2.1.1 Potential situations that might require the removal of non-osseointegrated implants

- Surgical complications
- Sub-optimal position with or without broken Transfer Piece
- Infection of the surrounding tissue
- Patient’s wish

2.1.2 Devices required for the removal of non-osseointegrated implants

Note:
For Straumann implants with the Loxim™ Transfer Piece, the Transfer Piece can be used to remove the implants. As with 48h Explantation Devices, the explantation with the Transfer Piece must only be done within 48h of implant placement. If the Transfer Piece (Loxim® or PURE Ceramic Implant Transfer Piece) is not available at the time of explantation, please use the 48h Explantation described below.

Warning:
In case the implant has to be removed after implant placement, the retention of the Transfer Piece (Loxim™ / PURE Ceramic Implant Transfer Piece) in the implant may be reduced. Always secure the implant against aspiration when removing the implant.

</table>
Note:
- The Straumann® 48h Explantation Devices must be used neither for adjusting the rotational position of the implant nor for adjusting its height. Otherwise the internal connection could be damaged.
- The Straumann® 48h Explantation Devices must only be used for the explantation of non-osseointegrated implants.
### 2.1.3 Step-by-step instructions for removal of non-osseointegrated implants

There are several surgical techniques for the removal of non-osseointegrated implants. The procedure shown below is recommended by Straumann.

<table>
<thead>
<tr>
<th>Bone Level</th>
<th>Soft Tissue Level</th>
<th>Straumann® PURE Ceramic Implant System</th>
</tr>

| Position the Explantation Device into the internal connection of the implant.  
Hand-tighten it to the implant with the Fixation Screw which secures the implant against aspiration. | Position the Explantation Device into the internal connection of the implant.  
Hand-tighten it to the implant with the Fixation Screw which secures the implant against aspiration. | Straumann PURE Ceramic Implant Monotype  
Snap the 48h Explantation Device onto the implant abutment. A click is heard when the 48h Explantation Device is attached correctly. |

![Diagram of Step 1](image)
**Step 2**

Use the Ratchet (Art. No. 046.119) and Holding Key (Art. No. 046.064) to slowly unscrew the implant by applying force counterclockwise to the 48h Explantation Device. The Holding Key is used for stabilization.

![Diagram](image1.png)

**Step 2**

Use the Ratchet (Art. No. 046.119) and Holding Key (Art. No. 046.064) to slowly unscrew the implant by applying force counterclockwise to the 48h Explantation Device. The Holding Key is used for stabilization.

![Diagram](image2.png)

**Step 2**

Use the Ratchet (Art. No. 046.119) and Holding Key (Art. No. 046.064) to slowly unscrew the implant by applying force counterclockwise to the 48h Explantation Device. The Holding Key is used for stabilization.

![Diagram](image3.png)

**Step 3**

Remove the implant and disposed of it.

![Diagram](image4.png)

**Step 3**

Remove the implant and dispose of it.

![Diagram](image5.png)

**Step 3**

Remove and dispose the tool with the implant.

![Diagram](image6.png)

**Warning:**

Removed implants must not be reused! The connection configuration of the implant might be damaged after usage of the 48h Explantation Device which may impact the prosthetic restoration.
2.1.4 Removal of a fractured Loxim™ or PURE Ceramic Implant Transfer Piece

The Loxim™ and PURE Ceramic Implant Transfer Piece are provided. (Step 1) If the Loxim™/PURE Ceramic Implant Transfer Piece breaks during implant insertion, one part remains in the Adapter and the other part in the implant. Both parts can be removed with tweezers.

To extract the implant, simply take out the broken part from the Adapter and re-insert the Adapter on the Loxim™/PURE Ceramic Implant Transfer Piece part remaining in the implant (Step 2). Counterclockwise turns will remove the implant.

The part of the Loxim™/PURE Ceramic Implant Transfer Piece below the cap are not secured in the Adapter and, additionally, need to be secured against aspiration when taking out the implant.

Warning:
In case the implant has to be removed after implant placement, the retention of the Loxim™/the PURE Ceramic Implant Transfer Piece in the implant may be reduced. Always secure the implant against aspiration when removing the implant.

Caution:
The broken parts of the Loxim™/PURE Ceramic Implant Transfer no longer protect against high torque. Therefore, it is not to be used to advance the placement of the implant.
2.1.5 Removal of a fractured Transfer Piece
A broken Transfer Piece is a result of a too high torque.

In case of fracture of the Transfer Piece, the following additional steps (steps 0a, 0b and 0c) are required first, followed by the general procedure shown in Step 1, Step 2 and Step 3 (see pages 16–19).

Note:
If the implant is positioned correctly, only the broken Transfer Piece has to be removed. The implant can be kept.

Caution:
Small parts can be swallowed or aspirated. Make sure the counter nut is not aspirated or swallowed! As a protection, the use of rubber dam or a fixation with dental floss is recommended.

<table>
<thead>
<tr>

<tr>
<td>Remove the counter nut from the implant. Unscrewing is not needed.</td>
<td>Remove the counter nut from the implant. Unscrewing is not needed.</td>
</tr>
<tr>
<td>In case of jamming, turn the counter nut counterclockwise with the Holding Key until it loosens. Then remove the counter nut.</td>
<td>In case of jamming, turn the counter nut counterclockwise with the Holding Key until it loosens. Then remove the counter nut.</td>
</tr>
<tr>
<td><strong>Step 0c</strong></td>
<td><strong>Step 0c</strong></td>
</tr>
<tr>
<td>Remove the remaining screw, which is still fixed with the implant by Tweezers, artery forceps or by hand with counterclockwise rotations.</td>
<td>Remove the remaining screw, which is still fixed with the implant by Tweezers, artery forceps or by hand with counterclockwise rotations.</td>
</tr>
</tbody>
</table>

Then follow steps 1–3 as described on pages 6 and 7.
2.2 Removal of osseointegrated implants

It is the clinicians’ responsibility to assess the extent of osseointegration at the time of the planned implant removal.

2.2.1 Potential situations that might require the removal of osseointegrated implants

- Unsatisfactory osseointegration
- Peri-implantitis
- Infection of the surrounding tissue
- Sub-optimal position of the implant
- Patient’s wish

2.2.2 Devices required for the removal of osseointegrated implants

For the removal of an osseointegrated Straumann dental implant an Explantation Drill as well as the corresponding explantation aid must be used.

Explantation Drills

Make sure that the length of the inner bore of the Explantation Drill is longer than the overall length of implant and explantation aid. Otherwise a full immersion of the Explantation Drill into the bone is not possible.

<table>
<thead>
<tr>
<th>Explantation Drill length</th>
<th>Maximum implant length</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>BL Implants</td>
</tr>
<tr>
<td>Short drill</td>
<td>10mm</td>
</tr>
<tr>
<td>Medium drill</td>
<td>all lengths</td>
</tr>
<tr>
<td>Long drill</td>
<td></td>
</tr>
</tbody>
</table>

Choose diameter of the Explantation Drill according to endosteal implant diameter. For TE Implants choose Explantation Drills for Straumann dental implants Ø 4.8mm. Note, there is no drill for the TE WN Implant (with shoulder Ø 6.5mm).

Note:

Osseointegrated Straumann® PURE Ceramic Implants (Monotype): Bone preservation is considered to be a core competence required by the clinician in the case of implant removal. The clinician should use a technique suitable to the implant and patient situation.

</tr>
</tbody>
</table>

No explantation aids for implants with abutment available for NN, NNC, NC and RC Implants.
Note:
For Straumann® Soft Tissue Level Implants, the overlapping implant shoulder needs to be ground with an appropriate grinding device (e.g. diamond bur) before explantation. The Explantation Drill can be used for controlling the fit. The grinding is not necessary for NN Implants.

Alternatively, the Guiding Cylinder may be used for guiding the grinding device.

- Always try to remove the Abutment and use the Guiding Cylinders instead of the Guiding Sleeves.
- SCS Screwdriver (see Straumann Product Catalog) is needed to hand-tighten the appropriate explantation aid.
- The Guiding Sleeves can be cemented onto Solid Abutments.
- The Guiding Sleeves cannot be used in combination with Angled Abutments.
- The Explantation Drills and explantation aids are intended for single use only.
2.2.3 Step-by-step instructions for removal of osseointegrated implants

<table>
<thead>
<tr>
<th>Bone Level</th>
<th>Soft Tissue Level</th>

</tr>
</tbody>
</table>

Remove the Healing Cap or the Abutment.

In case the Abutment cannot be removed, go to Step 2b, otherwise go to Step 2a.

Depth coding/marking on the Explantation Drills
The Explantation Drills feature a depth coding that allows evaluating the endosteal drilling depth. The first marking on the Explantation Drill starts at 6mm. The other markings follow in 2mm distances. The space between 10mm and 12mm is filled.
<table>
<thead>
<tr>
<th>Bone Level</th>
<th>Soft Tissue Level</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Step 2a</strong></td>
</tr>
<tr>
<td>Incise the mucosa to gain good access for the procedure.</td>
<td>Incise the mucosa to gain good access for the procedure. If possible, this step should be done after grinding.</td>
</tr>
<tr>
<td>Grind the overlapping part of the implant (not necessary for NN Implants) with an appropriate grinding device (e.g. diamond bur) in order to prepare the implant for the removal. Ensure ample cooling of the grinding device. Remove the debris with a surgical aspirator.</td>
<td>Grind the overlapping part of the implant with an appropriate grinding device (e.g. diamond bur) in order to prepare the implant for the removal. Ensure ample cooling of the grinding device. Remove the debris with a surgical aspirator.</td>
</tr>
</tbody>
</table>
### Step 3
- Hand-tighten the appropriate Guiding Cylinder using the SCS Screwdriver.

### Step 3a
- Hand-tighten the appropriate Guiding Cylinder using the SCS Screwdriver.

### Step 3b
- Hand-tighten or cement (for Solid Abutments) the appropriate Guiding Sleeve on the top of the Abutment.

### Step 4
- Choose the Explantation Drill and position it over the Guiding Cylinder.

### Step 4a
- Choose the Explantation Drill and position it over the Guiding Cylinder.

### Step 4b
- Choose the Explantation Drill and position it over the Guiding Sleeve.
### Step 5
Mill out the implant with the aid of the Explantation Drill. Use irrigation to avoid overheating of the bone.

### Step 5a
Carefully and with slow up and down movements, mill out the implant with the aid of the Explantation Drill. Regularly check mill depth according to marking on the Explantation Drill. Use irrigation to avoid overheating of the bone.

### Step 5b
Mill out the implant with the aid of the Explantation Drill. Use irrigation to avoid overheating of the bone.

### Step 6
Remove the implant using Tweezers or dental forceps by gentle rotation.

### Step 6a
Remove the implant using Tweezers or dental forceps by gentle rotation.

### Step 6b
Remove the implant using Tweezers or dental forceps by gentle rotation.

---

**Warning:**
Removed implants and devices must not be reused! In case Explantation Drill has to be de-attached from the Guiding Cylinder during procedure, verify tight fit of the Guiding Cylinder in the implant before re-attaching the Explantation Drill.
3. Further information

3.1 Care and maintenance

Some of the instruments mentioned in this guide are delivered sterile, some of them are delivered non-sterile. Please take notice of the product label.

Detailed information regarding sterilization methods can be found in the brochure Straumann® surgical and prosthetic instruments, Care and maintenance (152.008/en).
4. Important guidelines

Please note
Practitioners must have appropriate knowledge and instruction in the handling of the Straumann CADCAM products or other Straumann products (“Straumann Products”) for using the Straumann Products safely and properly in accordance with the instructions for use.

The Straumann Product must be used in accordance with the instructions for use provided by the manufacturer. It is the practitioner's responsibility to use the device in accordance with these instructions for use and to determine, if the device fits to the individual patient situation.

The Straumann Products are part of an overall concept and must be used only in conjunction with the corresponding original components and instruments distributed by Straumann, its ultimate parent company and all affiliates or subsidiaries of such parent company (“Straumann”), except if stated otherwise in this document or in the instructions for use for the respective Straumann Product. If use of products made by third parties is not recommended by Straumann in this document or in the respective instructions for use, any such use will void any warranty or other obligation, express or implied, of Straumann.

Availability
Some of the Straumann Products listed in this document may not be available in all countries.

Caution
In addition to the caution notes in this document, our products must be secured against aspiration when used intraorally.

Validity
Upon publication of this document, all previous versions are superseded.

Documentation
For detailed instructions on the Straumann Products contact your Straumann representative.

Copyright and trademarks
Straumann® documents may not be reprinted or published, in whole or in part, without the written authorization of Straumann. Straumann® and/or other trademarks and logos from Straumann® mentioned herein are the trademarks or registered trademarks of Straumann Holding AG and/or its affiliates.
