CI RD Straumann® PUREbase

Basic Information
This guide has been created for dental technicians and dentists working with the CI RD Straumann® PUREbase, designing screw-retained or cement-retained customized prosthetic reconstructions, such as copings, crowns or overdentures. It provides additional step-by-step information on working with the CI RD Straumann® PUREbase. Failure to follow the procedures outlined in these instructions may harm the patient and/or lead to any or all of the following complications: aspiration or swallowing of a component, breakage, infection.

Note: Implant-borne superstructures require optimal oral hygiene on the patient’s part. This must be considered by all parties involved when planning and designing the restoration. Not all detailed information can be found in this guide. Reference to available Straumann procedure manuals will be made throughout this document.

1 CI RD Straumann® PUREbase

The CI RD Straumann® PUREbase is a titanium base placed onto the Straumann® PURE Ceramic Implant to provide support for customized prosthetic restorations. It is indicated for screw-retained single tooth restorations, cement-retained single tooth restorations and cement-retained bridge restorations. The CI RD Straumann® PUREbase is available in two abutment heights, 3.5 mm and 5.5 mm.

The CI RD Straumann® PUREbase is supplied with a Basal Screw and a Bonding Aid. The Basal Screw is intended for fixing the abutment to the dental implant, while the Bonding Aid is indicated for the correct alignment between the CI RD Straumann® PUREbase and the coping/crown at implant shoulder level.

For details of intended use and instructions for use, please refer to the following Instructions for use: CI RD Straumann® PUREbase (702033/en) at http://ifu.straumann.com.

2 System Overview

2.1 Design

The CI RD Straumann® PUREbase (Fig. 1) differs from the Straumann Variobase family (Fig. 2): its narrower esthetic design and unique inner connection allows the Straumann® PUREbase to act as a stable inner core, while the crown/coping sits directly on the implant shoulder, forming the outer shell for the surrounding soft tissue.

2.2 Digital Workflow (CADCAM)

Digitally produced restorations of Straumann® PUREbase prosthetic components are accessible via three options*:
- Access the desired Straumann® PUREbase prosthetic components with the CARES® System and CARES® X-Stream.
- Connect your existing CAD software and mill the restoration on a Straumann PURE prosthetic component via Straumann® centralized milling facilities.
- Access the digital offering with the CARES® Scan & Shape Service or with your in-house milling equipment.

* Note: Some services may not be available in your country. Please contact your country sales representative for details.

PURE prosthetics requires digital planning. Traditional restoration in-lab, e.g. with burn-out copings or chair-side milling are not supported.
3  Lab procedure for CI RD Straumann® PUREbase

3.1 Preparation

Prerequisites
The tooth shade has been identified and noted (using color chart or digital measuring device). Both shade information and impression have been sent to the dental lab.

3.2 Open-tray Impression

Repositioning and fixing of CI RD Repositionable Implant Analog
Assemble the CI RD Repositionable Implant Analog in the impression. Fix the CI RD Repositionable Implant Analog and hand-tighten with the SCS Screwdriver in the impression using the guide screw.

Applying Sleeve
Mount the Sleeve onto the CI RD Repositionable Implant Analog. The Sleeve ensures proper fit of the CI RD Repositionable Implant Analog and controls occlusion height in the master cast. Only use new, undamaged and original Straumann® CI RD Implant Analogs.
3.3 Fabricating the master cast (with Sleeve and CI RD Repositionable Implant Analog)

Fabricate the master cast using standard methods and type-4 dental stone (ISO 6873). Embed Sleeve with the CI RD Repositionable Implant Analog in the stone. The CI RD Repositionable Implant Analog must not move in the master cast. A gingival mask should always be used to ensure that the emergence profile of the crown/coping is optimally contoured. Preferably use scannable material for the gingival mask.

3.4 Digital workflow

Assembling
Check for proper fit of the Scanbody in the Repositionable Implant Analog and hand tighten the self-retaining screw. Only use the Straumann® SCS Screwdriver to fix the Scanbody in the CI RD Repositionable Implant Analog. Check again for proper fit and for any rotational or vertical looseness. If a single-tooth restoration is planned, orient the angled surface of the Scanbody vestibular (not adjacent to the approximal tooth). Avoid any contact of the scanbody to proximal teeth.

Scanning and modelling
Follow the software provider’s instructions on how to scan and recognize the scanbody. Model the coping or crown/coping following the software provider’s instructions.

Note: The Straumann® Scanbodies and all components are intended for single use only. Multiple use of a scanbody can lead to inaccurate results.
3.5 Bonding

4. Remove CI RD Repositionable Implant Analog.

5. Insert the Bonding Aid (included in every Straumann® PUREbase package).

6. Shorten Bonding Aid when it sticks out at bottom of the master cast.

7. Remove the gingival mask.
Fix the Straumann® PUREbase abutment to the Bonding Aid with the respective screw and hand-tighten with the SCS Screwdriver.

**Note:** Cl RD Straumann® PUREbase and its components are non-sterile when delivered. Before placing the restoration in the patient’s mouth, the product must be cleaned, disinfected or sterilized.

*It is not necessary to sandblast the PUREbase to obtain a strong bond.*

Due to the symmetrical nature of the four cams, confirm the position of the crown/coping according to the actual patient anatomy prior to bonding.

**Note:** To ensure precise seating of the prosthetic restoration on the PUREbase, always bond on the master cast. Make sure the PUREbase is seated firmly on the bonding aid as the crown/coping has a direct contact surface to the implant shoulder.

Seal the screw channel with e.g. wax.

If specified in the adhesive/cement manufacturer’s processing instructions, apply appropriate primer agents to the PUREbase and restoration.
Apply a layer of self-adhesive cement to the inner surface of the crown/coping.

**Note:** Only suitable self-adhesive cementation systems for the respective material shall be used. Follow the manufacturer’s instructions for use for both the dental material and cement/bonding material.

Apply a layer of self-adhesive dental cement onto the upper third of the PUREbase. Use a clean brush to distribute cement over the entire bonding surface of the PUREbase.

Press the crown/coping down to the PUREbase/Bonding Aid.

Immediately remove excess cement from the screw channel (e.g. with a clean brush).
16 Ensure with a right/left movement that there is no cement between the Bonding Aid and the crown/coping.

17 Press the crown/coping down for at least two minutes to avoid the push-back effect of the cement which creates a microgap in the final restoration.

18 Follow the cement manufacturer’s instructions for hardening. Keep pressing down during hardening with UV light.
Unscrew the basal screw. Cement residuals remain on bonding aid.

Remove excessive cement using a sharp instrument. Do not use a rotating instrument.

Important: Check the result
Reposition the Repositionable Implant Analog onto the master cast and position the restoration. Check tight fit of restoration in master model or analog. If a gap is identified, repeat the procedure until the gap between implant and crown/coping has been eliminated.

Note: Remaining cement can lead to a microgap and untight fit of the final restoration.
Do not fire the abutment after bonding.
3.6 Insertion (dental practice)

Fix the final restoration on the master cast before delivery to the dentist. Check tight fit of restoration in master model or analog. **Deliver only when there is no visible microgap between restoration and implant analog.**

**Step 1 – Preparation**
- Remove the healing cap or temporary restoration.
- Remove the restoration from the master cast and unscrew the PUREbase prosthetic components from the CI RD Repositionable Implant Analog.
- Thoroughly clean and dry the interior of the implant and the abutment.

**Note:** Always ensure that surfaces of threads and screw heads are clean and that a new screw is used for the final restoration.

**Step 2 – Final insertion**

**Option A: Screw-retained final restoration**
Position the sterilized PUREbase prosthetic restoration in the implant. Tighten the screw to 35 Ncm using the SCS Screwdriver together with the Ratchet and the Torque Control Device. Close the SCS screw channel with cotton and sealing compound (i.e. gutta-percha). This allows for subsequent removal of the PUREbase in case a crown/coping or overdenture replacement should be required.

**Option B: Cement-retained final restoration**
Position the sterilized PUREbase in the implant. Tighten the screw to 35 Ncm using the SCS Screwdriver together with the Ratchet and the Torque Control Device. Close the screw channel with cotton and sealing compound (e.g. gutta-percha). This allows for subsequent removal of the PUREbase in case a crown/coping replacement should be required. Cement the superstructure to the abutment. Remove excess cement. Check the horizontal implant-abutment connection for possible gaps.
