Peri-implantitis
New insights

Peri-implantitis
Inflammation affecting the soft tissue and bone around dental implants. If not treated it can lead to implant loss.

Contributing factors

Healthy tissue

Inflammation

Healthy tissue

Result

The findings in this study are extremely relevant for dentists and patients who base their choice of implant on independent clinical evidence. These results add weight to previous reported findings showing high success rates with Straumann implants.

Study overview

- 25,000 patients in 2003
- 427 patients randomly selected
- 9 years after treatment patients were retrospectively analyzed for peri-implantitis represented over 90 % of the implants

Nobel Biocare
Straumann
Others

Implants (≥ 4) used by specialist in patients with no periodontitis

Implant system
