

A Prospective Clinical Study to Evaluate the Performance of PURE Ceramic Implants in Single Tooth Gaps: 3-Year Results¹

Kai-Hendrik Bormann, Nils-Claudius Gellrich, Heinz Kniha, Sabine Schild, Dieter Weingart, Michael Gahlert

Aim

- To evaluate the mid-term clinical performance of a Straumann® PURE Ceramic Implant Monotype in single-tooth gaps in the maxilla and mandible
- To confirm the previously published results² on hard and soft tissue parameters after 3 years of follow-up

Study duration

3 Years

Patients

17 27

Mean age

48 Years

Study design

Indication

Single tooth gaps

Protocol

Transmucosal implant placement in healed extraction sites

Provisionalization

After 12–14 weeks

Final restoration

After 28 weeks

Study implant

Straumann® PURE Ceramic Implant Monotype

STABLE bone levels

After an initial remodeling phase (0–6 months), crestal bone level remained stable, 0.09 mm change between 6 months and 3 years.

EXCELLENT performance

Implant success and survival after 1 and 3 years follow-up vs. meta-analysis³

Conclusions

- Straumann® PURE Ceramic Implant Monotype shows excellent survival and success rates of 97.5% and stable bone levels after 3 years of follow-up.
- The PURE Ceramic Implant Monotype offers a reliable and successful treatment alternative to Titanium implants.
